ABOUT POSEIDON OFFSHORE ENERGY

Focused Engineering Support for Offshore Projects

Welcome to Poseidon Offshore Energy, an independent offshore and marine engineering and project management consultancy supporting Oil & Gas, Offshore Renewables and marine projects. We provide practical, project-focused engineering support that bridges the gap between design development, mobilisation and offshore execution.

About Poseidon →

SIX CONNECTED DISCIPLINES

Breadth, without losing the thread.

One page explains the scope before introducing the individual services.

Engineering Excellence Across Every Discipline

Poseidon Offshore Energy provides focused engineering support for offshore contractors, vessel owners and project teams across Europe.

Our services cover transportation and installation engineering, structural analysis and detailed design, cable installation engineering, hydrodynamic and operability analysis, naval architecture, vessel modifications, electrical and instrumentation engineering, and process, piping and layout design.

Support can be provided for feasibility studies, concept development, FEED, detailed design, independent technical reviews, mobilisation engineering and offshore execution preparation. The scope, inputs, assumptions, interfaces and deliverables are agreed according to the requirements of each assignment.

01 — DEFINE & ASSESS

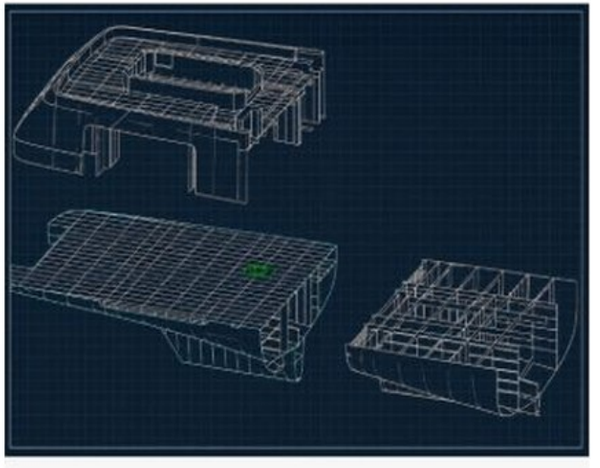

Planning. Coordination. Vessel expertise.

Complete service cards connect the engineering discipline with the practical support available.

Offshore Project Management & Planning

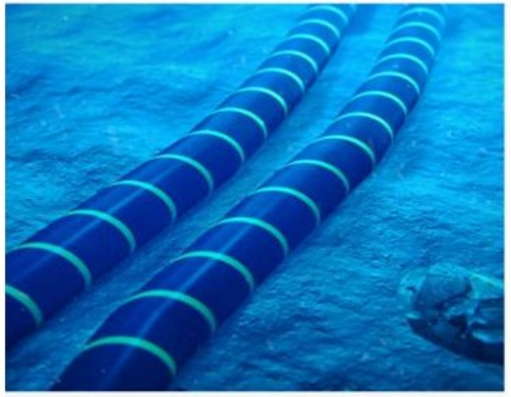

Project management, planning and engineering coordination for offshore and marine assignments, from early definition through design, mobilisation and execution support. Services include scope definition, Primavera P6 and MS Project scheduling, progress monitoring, forecasting, interface management, technical coordination, risk and action tracking, contractor and vendor follow-up, reporting and support to client decision-making.

Naval Architecture & Marine Engineering

Naval architecture and vessel-engineering support for offshore operations, project equipment integration and vessel suitability assessments. Services include stability, loading conditions, weight and centre-of-gravity control, deck-capacity reviews, vessel capability assessments, general arrangement development, freeboard considerations, marine-system interfaces and class-support activities.

From installation loads to structural detail.

Cable Installation Engineering

Engineering support for offshore power, telecommunications and subsea cable installation, recovery and repair operations. Services include cable-lay analysis, installation tension assessment, minimum bend-radius verification, overboarding, pull-in engineering, touchdown behaviour, suspended spans, shore approaches, cable handling, burial interfaces and installation procedures.

Structural Analysis & Detailed Design

Structural analysis and detailed design for offshore structures, temporary works, vessel modifications, equipment foundations and installation systems. Services include global and local analysis, finite-element modelling, strength and fatigue checks, deck assessments, reinforcement design, grillage and seafastening, lifting points, support structures, fabrication drawings and material take-offs.

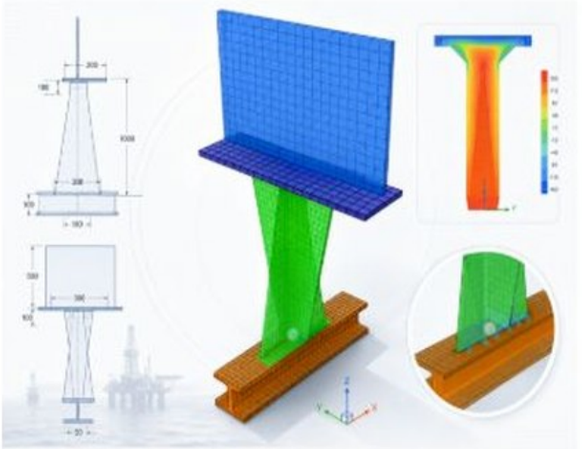

02

Cable installation and structural design, presented as distinct but connected capabilities.

Process, Piping & E&I Engineering

Process, piping, electrical, instrumentation and control engineering for offshore facilities, vessel modifications and temporary project systems. Services include P&ID review, piping design basis, line and tie-in lists, hydraulic assessment, layout and routing, electrical load definition, cable routing, field instrumentation, control philosophies, I/O lists, SIS and ESD interfaces, vendor reviews and commissioning input.

Drafting & Design Support

Detailed engineering and design support for structural, marine, piping and installation scopes. Services include 2D and 3D modelling, finite-element analysis, design calculations, fabrication and installation drawings, deck layouts, grillage, seafastening, lifting and rigging details, material take-offs and as-built documentation.

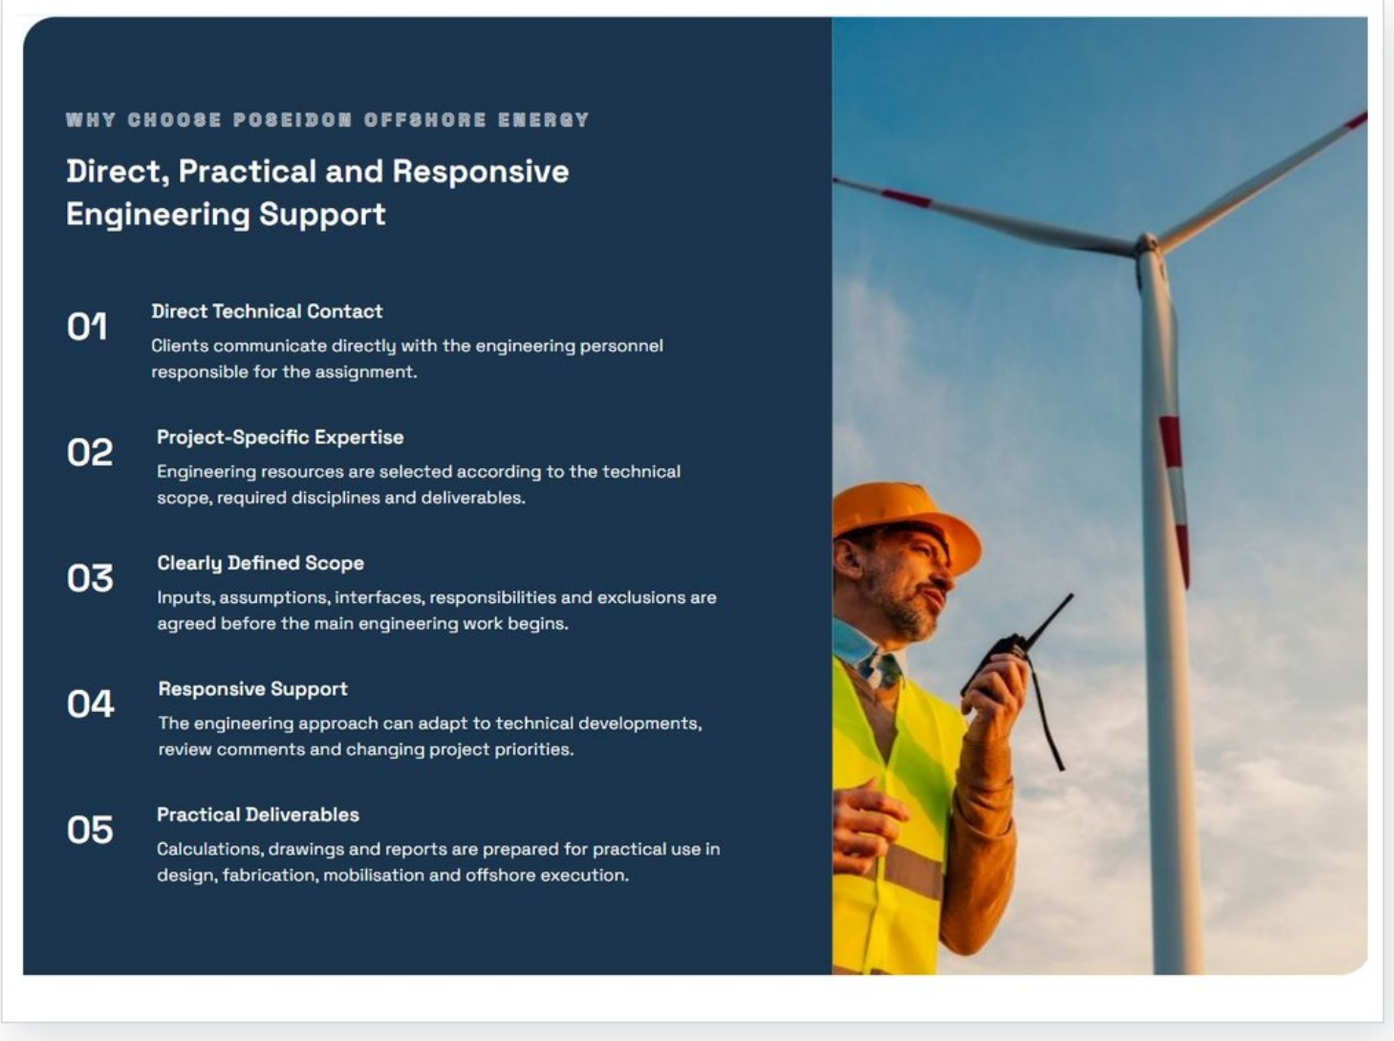

03 — DEVELOP & DOCUMENT

Systems. Drawings. Deliverables.

Process, piping, E&I and detailed design extend the offer from analysis into usable project documentation.

Direct support. Practical outcomes.

The website explains how assignments are scoped, resourced and delivered.

A PROJECT, STEP BY STEP

A clear beginning for complex work.

05

Steps from engineering needs to execution preparation.

Technical depth. Direct involvement.

BASED IN ROTTERDAM

Built around the assignment.

The company introduction puts the people, project context and practical use of the deliverables into focus.

Who We Are

Poseidon Offshore Energy B.V. provides specialist offshore and marine engineering for contractors, vessel owners and project teams across Europe.

Based in Rotterdam, we support transportation and installation scopes, structural analysis and detailed design, cable installation engineering, hydrodynamic analysis, naval architecture and vessel modifications.

Clients work directly with experienced engineering personnel throughout the assignment, enabling clear communication, responsive technical support and practical deliverables aligned with the project's design, fabrication, mobilisation and offshore installation requirements.

What guides the engineering.

Five principles translate expertise into a clear working philosophy.

Purpose, in practice.

Mission and vision stay within a compact tabbed component, keeping the company narrative focused.

OUR MISSION

OUR VISION

Technical capability, clearly defined.

The capability carousel gives each engineering discipline its own space.

Technical Capability Areas

Our senior specialists combine decades of international experience across Oil & Gas, Offshore Renewables, and Marine Engineering sectors.

Transportation & Installation Engineering

Engineering for the transportation and offshore installation of structures, subsea assets and project equipment. Typical support includes transport configurations, vessel suitability, installation sequences, load cases, operational limits, installation procedures, interface reviews and offshore-readiness documentation.

Structural Analysis & Detailed Design

Structural analysis and detailed design for offshore structures, temporary works, equipment foundations, vessel modifications and installation systems. Capabilities include global and local analysis, finite-element modelling, strength and fatigue checks, deck assessments, reinforcement design, support structures, fabrication drawings and material take-offs.

Cable Installation Engineering

Engineering for offshore power, telecommunications and subsea cable installation, recovery and repair activities. Capabilities include cable-lay analysis, installation tension assessment, bend-radius verification, overboarding, touchdown behaviour, suspended spans, pull-in engineering, shore approaches, cable handling, burial assessment and installation procedures.

An editorial space for expertise.

Articles, topic categories and search extend the engineering story.

By **Poseidon Offshore Energy** • 5 June 2026

Transportation and Installation Engineering for Offshore Projects

Transportation and installation engineering is often underestimated until the project reaches mobilisation. By then, the vessel is being fixed, cargo data is still changing, the deck layout is being squeezed around available space, the...
